

COPELAND SCROLL™ COMPRESSORS 60HZ

# THE INDUSTRY BREAKTHROUGH

**EMERSON**  
Climate Technologies

## PRODUCT DESCRIPTION

Until a few years ago, the problems of complex part geometries and precise tolerance requirements made scroll technology impossible to manufacture in high volumes at low costs. But after a ten-year effort, Copeland Corporation developed design and manufacturing technologies that solved these problems.

Copeland achieved two major breakthroughs: the Copeland Scroll™ and the exclusive manufacturing process required to produce this compliant scroll compressor.

Compliance refers to the method in which the two scroll members interact to achieve high efficiency and durability simultaneously. Copeland's unique and patented approach, achieving both radial and axial compliance, has several advantages:

- Continuous flank contact, maintained by centrifugal force, minimizes gas leakage and maximizes efficiency.
- Radial compliance allows the scroll members to separate in the presence of liquid refrigerant or debris, eliminating high stress in the members and substantially improving durability of the compressor.
- Axial compliance allows the scroll tips to remain in continuous contact in all normal operating conditions, ensuring minimal leakage . . . without the use of tip seals. Copeland Scroll performance will not degrade over time because there are no seals to wear and cause gas leakage. In fact, over time, the compressor's performance improves as the scrolls wear-in.

Because of its compliant feature, Copeland's scroll has unprecedented liquid-handling capability. No accumulator or crankcase heater is required in most system applications. In addition, it is designed to start under any system load. This feature eliminates the need for start kits.

Combined, these characteristics simplify system design and increase system reliability.

Model selections, electrical choices and operating conditions can be found in the pages that follow. This 60 hertz book should better assist you with your final product selection.

Copeland Corporation has a reputation for quality and technology leadership that has been earned through years of performance. Copeland has more than 5,000 employees around the world working to ensure the reliability of its products. At 20 manufacturing facilities in eleven countries, Copeland goes about its only business – making compressors. These efforts assure our customers they are purchasing the most advanced compressor products that are backed by Copeland quality.

## FEATURES

- Ultra High Efficiency
- High Heat Pump Capacity Due to Nearly 100% Volumetric Efficiency
- Wide Selection Range
  - 60 Hertz 18100 to 81500 BTUH
  - 4560 to 20500 KCALH
  - 5300 to 23900 WATTS
- R22 and R407C Refrigerants
- Fewer Moving Parts
- Rugged Design and Proven Durability
- Compliance Feature Offers Unprecedented Liquid Handling Capability
- Crankcase Heater or Accumulator Not Required in Most Applications
- Performance Improves as Scroll Sets Wear-In
- Five Decibels Quieter than Piston Compressors
- Very Low Gas Pulsation
- Straight Suction Tube Allows For Low Profile Application
- Molded Plug Terminal Connector Option
- Unloaded Start Feature Requires No Start Capacitors
- Internal Motor Protection with Start Winding Protection on Single Phase Models
- Full Maximum Load Rundown Capability
- High Volume Production with Over Thirteen Years of Scroll Manufacturing Experience
- Nomenclature Reflects Nominal 60 Hertz Capacity
- Third Generation ZR3 Scrolls Break 20.0 Cheer Barrier
- Award Winning Design
- Tandem Availability

## ZR COPELAND SCROLL™ STORY

In 1987 Copeland responded to the needs of manufacturers and consumers with the introduction of the ZR1 Copeland Scroll compressor. Today, worldwide installations total nearly ten million systems. And the reliability and performance standards which have been established by the Copeland Scroll compressor have yet to be matched by any other manufacturer of compressor technology in production today.

In 1991 Copeland launched the ZR2 compressor – offering a higher EER and expanding scroll to 4-5 horsepower. The ZR2 compressor raised performance levels to 11.5 EER at ARI and 19.5 EER at CHEER while offering even higher levels of reliability. Very rapidly the ZR2 had become the compressor of choice by virtually every manufacturer of high efficiency systems.

Now, Copeland has introduced the next generation of scroll technology – the ZR3 compressor. This model incorporates the latest engineering developments in scroll form optimization and porting. As a result the ZR3 becomes the first compressor to break through the 20.0 CHEER rating barrier, offering up to twelve percent higher efficiency than advanced reciprocating compressors on the market today. This new performance plateau was established while maintaining the high standards of durability and liquid handling inherent in Copeland Scroll technology. The ZR3 product line includes 1½ to 4 ton models designed for both residential air conditioning and heat pump applications.

The ZRKC is a new family of 3¾ to 6¾ ton Copeland Scroll compressors, designed specifically for 10.0 SEER unitary applications and 9.0 EER commercial applications.

Scroll technology can be adapted easily and modified to fit any desired operating condition. By redesigning motors and making patented changes in the performance characteristics of the scroll sets, Copeland can adapt the revolutionary Copeland Scroll compressor to meet any market need.

By broadening the scroll product offering, Copeland now brings the advantages of scroll technology – higher efficiency, superior sound performance and unmatched reliability potential to more models.

Each model employs the axial and radial compliance for which Copeland Scroll is famous, making it the most efficient hermetic compressor in its class.

Copeland's scroll technology has proven to be the ultimate technology for today's compressor designs, as well as those of the future. As the world leader in scroll technology, you can expect Copeland to continue to advance state-of-the-art products to meet the industry's ongoing requirements for higher efficiency systems.

## BILL OF MATERIAL PROVISIONS

Copeland is pleased to offer the bills of material shown on the previous pages that offer a complete and versatile choice to your compressor selection.

In addition to the marked features, each compressor will include the following:

- Wiring diagram.
- Internal line break protector.
- Rubber grommet mounting parts with sleeves (kit 527-0116-00).
- Grounding tab located in the compressor terminal box.

See outline drawing pages 20 to 25 for stub tube and rotalock connection sizes.

## ACCESSORY INFORMATION

Crankcase Heater - 240 volt - 70 watt (ZR22 to ZR81)	018-0057-00
Crankcase Heater - 480 volt - 70 watt (ZR22 to ZR81)	018-0057-01
Crankcase Heater - 575 volt - 70 watt (ZR32 to ZR81)	018-0057-02

## ROTALOCK SERVICE VALVES

For your ZR rotalock connection compressor, please order the valves separately by choosing them from the tables below.

### Valve Style

Table A illustrates the style for each valve listed in Tables B and C. The drawings in this table will show gage port quantity and location. The gage ports are 1/4 inch flare fittings and include brass caps.

### Valve Kits

The kits listed in Table B below, include rotalock suction and discharge service valves and seals for the ZR models shown. Use of these with your ZR rotalock connection compressors will simplify your order and inventory process.

### Special Kits

If the kits are not ordered, special valves and seals should be selected from Table C below to fit the rotalock connections supplied on the ZR compressor. A suggestion is to select valves having the same line sizes as the connections supplied on compressors with stub tubes. Be sure to match rotalock connection sizes.

**TABLE A**

STYLE 1	STYLE 2	STYLE 3	STYLE 4

## COMPRESSOR WIRING DIAGRAMS

### SINGLE PHASE MOTOR

**ZR18 TO ZR61**

USE MINIMUM 75° C WIRE FOR AMPACITY DETERMINATION  
 USE THIS EQUIPMENT ON A GROUNDED SYSTEM ONLY  
 INTERNAL MOTOR PROTECTION. ALLOW TIME FOR RESET  
 USE COPPER CONDUCTORS ONLY

### THREE PHASE MOTOR

**ZR22 TO ZR81**

CRANKCASE HEATER, WHEN PROVIDED, MUST BE FIELD CONNECTED TO SEPARATE VOLTAGE SOURCE  
 USE MINIMUM 75° C WIRE FOR AMPACITY DETERMINATION  
 USE THIS EQUIPMENT ON A GROUNDED SYSTEM ONLY  
 INTERNAL MOTOR PROTECTION. ALLOW TIME FOR RESET  
 PRIMARY SINGLE PHASE FAILURE PROTECTION IS PROVIDED  
 TO CORRECT IMPROPER MOTOR ROTATION, SWITCH ANY TWO SUPPLY LINES  
 USE COPPER CONDUCTORS ONLY

Production compressors to meet above nominal performance values within ± 5%.

## HOW A SCROLL WORKS

Compression in the scroll is created by the interaction of an orbiting spiral and a stationary spiral. Gas enters the outer openings as one of the spirals orbits.

The open passages are sealed off as gas is drawn into the spiral.

As the spiral continues to orbit, the gas is compressed into two increasingly smaller pockets.

By the time the gas arrives at the center port, discharge pressure has been reached.

Actually, during operation, all six gas passages are in various stages of compression at all times, resulting in nearly continuous suction and discharge.

The scroll is a simple compression concept first patented in 1905. A scroll is an involute spiral which, when matched with a mating scroll form as shown above, generates a series of crescent-shaped gas pockets between the two members. During compression, one scroll remains stationary (fixed scroll) while the other form (orbiting scroll) is allowed to orbit (but not rotate) around the first form. As this motion occurs, the pockets between the two forms are slowly

pushed to the center of the two scrolls while simultaneously being reduced in volume. When the pocket reaches the center of the scroll form, the gas, which is now at a high pressure, is discharged out of a port located at the center. During compression, several pockets are being compressed simultaneously, resulting in a very smooth process. Both the suction process (outer portion of the scroll members) and the discharge process (inner portion) are continuous.

## APPLICATION NOTES

- The Copeland Scroll Compressor has been under development at Copeland since 1979 and is the most efficient and durable compressor we have ever developed for residential air conditioning and heat pump applications. Scroll compressors have fewer moving parts and no dynamic suction or discharge valves. In addition, they offer very low vibration and sound levels and are very tolerant to stresses caused by liquid slugging, flooded starts, and debris commonly found in residential split air conditioning and heat pump systems.
- These Copeland Scrolls include a higher range of capacities and more electrical options than the earlier ZR1 models. In addition, there are several operating characteristics and design features which are different from the ZR1 models.
- The Copeland Scroll is a new type of compressor and there are a number of application characteristics which are different from the traditional reciprocating compressor. These are fully detailed in Application Bulletin AE 4-1312.
- The motor protector used in these ZR compressors is mounted internally and its proven design is the result of extensive laboratory research and field testing. It protects the motor from maximum operating overload, both high and low voltage, and loss of refrigerant charge. It is both current and heat sensing. The single phase protector protects both the run and start windings. The three phase protector is wired at the connection point of the motor's three legs. Therefore, the protector protects all three legs and if a problem occurs with one or more of them, the protector breaks all three phases.
- The rotational speeds of the compressor are:
  - 50 Hertz 2900 RPM
  - 60 Hertz 3500 RPM
- No crankcase heater is required for single phase compressors.
- A crankcase heater is required for three phase compressors when the system charge exceeds the compressor refrigerant charge limit shown below, and no accumulator is used or when the charge exceeds this limit and an accumulator cannot be piped to provide free liquid drainage into the accumulator during the off cycle.
  - ZR18 to ZR48 8 pounds (3.6 Kg)
  - ZR54 to ZR81 10 pounds (4.5 Kg)
- Since Copeland Scroll Compressors have very high volumetric efficiency, their displacements are lower than for comparable capacity reciprocating compressors. As a result, Copeland recommends that the capacity rating on reversing valves be no more than 1.5 to 2 times the nominal capacity of the compressor with which it will be used in order to ensure proper operation of the reversing valve under all operating conditions.
- The compressor has the approval to operate as a heat pump within the operating range. Its increased bearing surfaces and improved lubrication system provide excellent reliability even when operated at the heat pump's higher compression ratios.
- Low ambient cut-outs are not required to limit heat pump operation.
- These scroll Compressors have internal pressure relief valves which open at a discharge to suction differential pressure of 375 to 450 psi.
- No start assist devices are required. Due to the inherent design of the scroll, the internal compression components always start unloaded even if system pressures are not balanced.
- Rated load amps is the value used for contactor and other electrical component selection. It is calculated by dividing the maximum continuous current that the compressor draws under the condition of maximum load operation and the lowest operating voltage by 1.4. See Application Bulletin AE 9-1154 for a detailed explanation.
- Complete 60 Hertz performance curves are available in the units as follows for all models:
  - Capacity BTU/Hr
  - Power Input Watts
  - Current Amps
  - Efficiency BTUH/Watt
- Copeland has compiled a book of compressor Application Bulletins. Please see the following bulletins, from the book, for more ZR compressor application information as entitled below:
  - Mounting Parts ..... AE 4-1111
  - Application Guidelines ..... AE 4-1312
  - Nameplate Amperage Rating ..... AE 9-1154
  - Nameplate Voltages ..... AE 9-1228
  - Maximum Continuous Current Rating..... AE 9-1250
  - Run Capacitors ..... AE10-1272

## COMPRESSOR SPECIFICATION

The compressor shall be a Copeland Scroll type, with an internal start winding overload motor protector on all single phase models. For maximum compressor life the compressor should include a minimum of 38 ounces (1.12 liters) of oil. The compressor shall be capable of operating within the evaporating range of -10°F to 55°F (-23.3°C to 12.8°C). The compressor

must also be capable of operating at condensing temperatures up to 150°F (65.6°C). The compressor shall operate at an ARI point minimum efficiency of 10.1 BTU/WATT. Efficiencies of better than 10.1 BTU/WATT are acceptable, but efficiencies below 10.1 BTU/WATT are not acceptable. The compressor shall be of the Copeland ZR type or approved equal.

## APPLICATION NOTES

Use of the Copeland Scroll Compressor in a tandem configuration follows the guidelines of the single compressor with the following exceptions:

- The refrigerant charge limit for the tandem compressor is 12 pounds (5.4 kg). A three-phase unit with a charge over twelve pounds must have crankcase heaters added to both compressors. The crankcase heater must be located close to the mounting feet for maximum effectiveness. The initial start in the field is a very critical period for any compressor because all load bearing surfaces are new and require a short break in period to carry high loads under adverse conditions. The crankcase heater must be turned on 12 to 24 hours prior to starting the compressor. This will prevent oil dilution and bearing stress on initial start up.
- The ZRT92 - ZRT122 compressors are mounted on rails using rubber mounting parts. The ZRT136 - ZRT162 compressors are rigidly mounted on rails using solid steel mounting parts. These mounts are installed at the factory and should not be loosened. Tighten to 125 inch pounds (14 NM) if it becomes necessary to tighten these mounts. Holes in the mounting rails may be used to mount isolation grommets under the entire tandem.
- A discharge check valve must be placed in the common discharge line when pump down is used.
- Both compressors must be at the same level to prevent oil from migrating to the lowest compressor through the oil equalization line.

- Compressors may be individually cycled.
- Individual compressors should not be replaced in the field. The entire tandem compressor unit must be replaced if it becomes necessary to replace one compressor. Individual compressors configured for tandem usage will not be available for replacement.
- In the case of a motor burn, the majority of contaminated oil will be removed with the compressor. The rest of the oil is cleaned through use of suction and liquid line filter driers. A 100% activated alumina suction filter drier is recommended but must be removed after 72 hours. See Application Engineering Bulletin 24-1105 for clean up procedures and AE Bulletin 11-1297 for liquid line filter-drier recommendations. **It is highly recommended that the suction accumulator be replaced if the system contains one.** This is because the accumulator oil return orifice or screen may be plugged with debris or may become plugged shortly after a compressor failure. This will result in starvation of oil to the replacement compressor and a second failure.
- Complete 60 Hertz R22 performance curves are available in the units as follows for all models:
  - Capacity BTU/Hr
  - Power Input Watts
  - Current Amps
  - Efficiency BTUH/Watt

## TANDEM SPECIFICATION

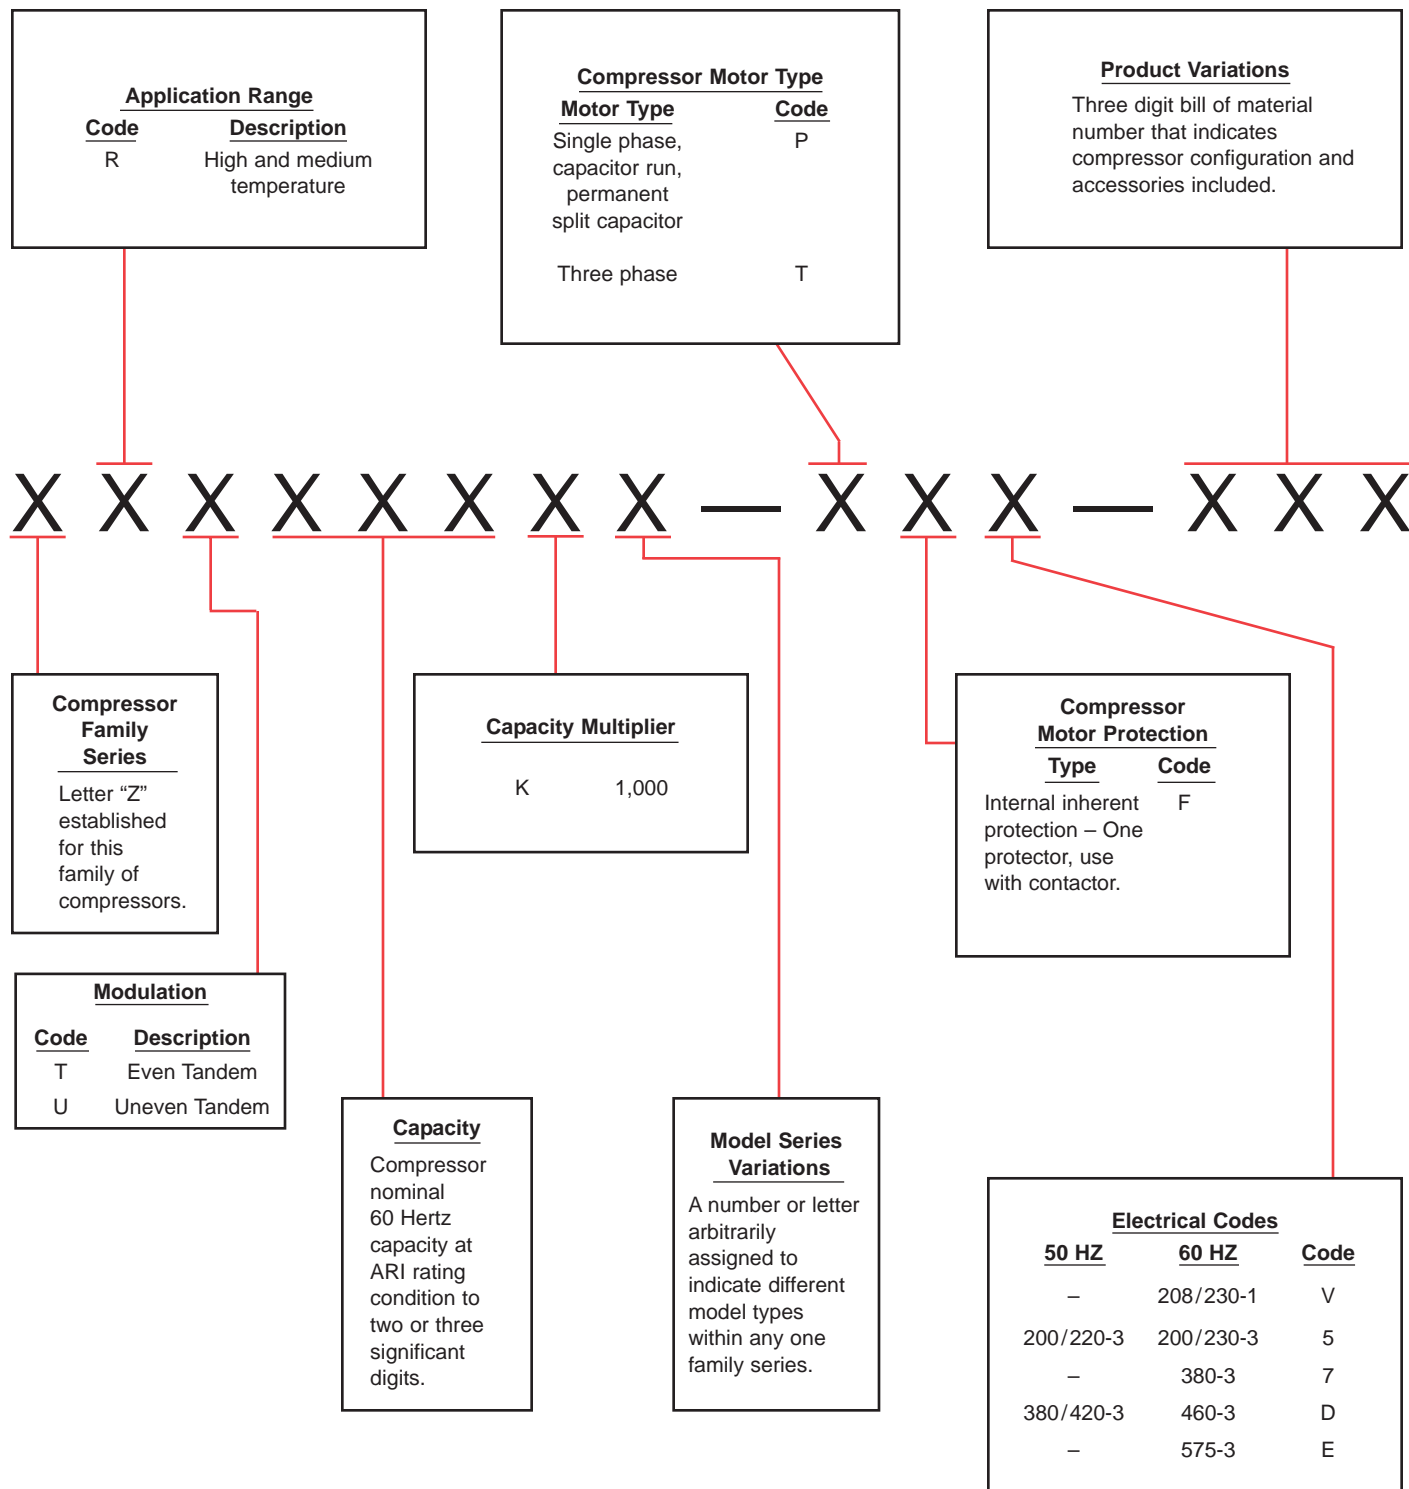

The tandem shall be Copeland Scroll type, with two internal overload motor protectors. For maximum compressor life the tandem should include a minimum of 114 ounces (3.37 liters) of oil. The tandem shall be capable of operating on R22 within the evaporating range of -10°F to 55°F (-23.3°C to 12.8°C). The tandem must also be capable of

operating at condensing temperatures up to 150°F (65.6°C). The tandem shall operate at an ARI point minimum efficiency of 11.0 BTU/WATT. Efficiencies of better than 11.0 BTU/WATT are acceptable, but efficiencies below 11.0 BTU/WATT are not acceptable. The tandem shall be of the Copeland ZR type or approved equal.

### UNITS CONVERSION CHART

BTUH × 0.252 = KCALH  
 BTUH × 0.293 = WATTS  
 (°F - 32) ×  $\frac{5}{9}$  = °C  
 POUNDS × 0.454 = KILOGRAMS  
 INCHES × 25.4 = MILLIMETERS  
 CUBIC INCHES × 16.386 = CUBIC CENTIMETERS  
 FLUID OUNCES × 0.02957 = LITERS  
 CUBIC FEET × 0.02831 = CUBIC METERS  
 HORSEPOWER × 0.746 = KILOWATTS

## PRODUCT DESCRIPTION

Until a few years ago, the problems of complex part geometries and precise tolerance requirements made scroll technology impossible to manufacture in high volumes at low costs. But after a ten-year effort, Copeland Corporation developed design and manufacturing technologies that solved these problems.

Copeland achieved two major breakthroughs: the Copeland Scroll™ and the exclusive manufacturing process required to produce this compliant scroll compressor.

Compliance refers to the method in which the two scroll members interact to achieve high efficiency and durability simultaneously. Copeland's unique and patented approach, achieving both radial and axial compliance, has several advantages:

- Continuous flank contact, maintained by centrifugal force, minimizes gas leakage and maximizes efficiency.
- Radial compliance allows the scroll members to separate in the presence of liquid refrigerant or debris, eliminating high stress in the members and substantially improving durability of the compressor.
- Axial compliance allows the scroll tips to remain in continuous contact in all normal operating conditions, ensuring minimal leakage . . . without the use of tip seals. Copeland Scroll performance will not degrade over time because there are no seals to wear and cause gas leakage. In fact, over time, the compressor's performance improves as the scrolls wear-in.

Because of its compliant feature, Copeland's scroll has unprecedented liquid-handling capability. No accumulator or crankcase heater is required in most system applications. In addition, it is designed to start under any system load. This feature eliminates the need for start kits.

Combined, these characteristics simplify system design and increase system reliability.

Model selections, electrical choices and operating conditions can be found in the pages that follow. This 60 hertz book should better assist you with your final product selection.

Copeland Corporation has a reputation for quality and technology leadership that has been earned through years of performance. Copeland has more than 5,000 employees around the world working to ensure the reliability of its products. At 20 manufacturing facilities in eleven countries, Copeland goes about its only business – making compressors. These efforts assure our customers they are purchasing the most advanced compressor products that are backed by Copeland quality.
